

PROOF-AUTHORIZED PRIVATE SPENDING

HIMITSU Protocol

Spend private funds directly.
Without a third-party relayer.

THE PROBLEM

Current privacy protocols
depend on a relayer

TORNADO CASH: THE RELAYED WITHDRAWAL

THE RELAYER'S ROLE

Submit the transaction

The relayer signs an outer transaction and calls the pool.

Pay for the gas

The relayer pays ETH for gas and receives a fee from the withdrawal.

Handle the request

The relayer can refuse or delay submission and can log request metadata.

THE DEPENDENCY WE REMOVE

Users needed a funded account or a centralized relayer

Self-submission required gas funding that could introduce a link.

Relayed submission depended on a relayer's availability and acceptance.

Remove the relayer altogether

Your browser sends the transaction directly to RPC.

The pool checks your proof. The paymaster contract pays for gas.

HIMITSU: DIRECT SUBMISSION AND SETTLEMENT

01 DEPOSIT + SAVE

02 PROVE LOCALLY

03 AUTHORIZE + SETTLE

ETH-funded paymaster

No per-transaction operator signature. No token allowance to the DEX.

HOW EIP-8141 ENABLES THE FLOW

ONE EIP-8141 FRAME TRANSACTION

Execution authority and gas payment are approved separately.

WHAT CHANGES

Responsibility	Tornado Cash	Himitsu
Transaction sender	Relayer	Privacy pool
Submission	Relayer	Your browser
Gas payment	Relayer	Paymaster
Submission approval	Relayer	No relayer needed

WHAT USERS CAN DO

Withdraw

Swap and withdraw
